

CLEANING

Maintain your product by cleaning regularly. Dirt and mud should be brushed off once it has dried naturally. Wipe with a clean damp cloth if necessary.

Never wash in the washing machine. Immersion in and exposure to detergents can attack the stitching and the bonding agents within the product.

If in contact with chemicals, oil, petrochemicals, try to safely remove as soon as possible.

WATERPROOF TREATMENT

If you have purchased a water resistant / leather product, the leather must regularly be treated with waterproofing and conditioning sprays or creams. Used in wet conditions the leather will experience a gradual loss of its natural water-resistant qualities, and if untreated the leather will slowly harden, crack and leak.

GENERAL CARE

In some of our products we use a treatment in the lining such as Agion® which wicks moisture and sweat away from the foot to help prevent unpleasant odours.

To retain the shape and durability of your products, ensure the laces are undone fully before the product is removed.

DRYING

Open the footwear as much as possible allowing the product to dry slowly using natural air circulation at room temperature, do not subject the product to any direct heat source.

Paper may be used to stuff the product in the drying process to help absorb moisture and maintain the shape of the product.

LININGS

All linings used in our products are designed to be a comfortable breathable material that requires little maintenance. Foot moisture is absorbed and released in the drying process due to the breathable nature of the linings.
